

Build me a complete YouTube channel blueprint from scratch. Start with nothing but the vidIQ connection, the YouTube Data API, and the open internet. Find a real, demand-validated, underserved YouTube opportunity that real people are actively searching for and already watching content about right now, design a YouTube channel blueprint around it, build the positioning and the brand and the content engine, and hand me a finished channel blueprint I could take to launch this month. Then prove to me why it would work.

Discover opportunities using the vidIQ connection, validate them using the YouTube Data API, and use broader web research to understand audience demand, commercial value, and market context. Select a niche only when evidence from all three aligns. Use the full capabilities of the vidIQ connection wherever they materially improve the quality of your research, analysis, or recommendations. Do not optimize for individual keywords. Optimize for a repeatable YouTube channel opportunity with enough proven audience demand, attainable competition, and topic depth to sustain long-term growth.

This is a test of how far you can go on your own. I am not going to answer questions mid-run. Make every call yourself, write down why you made it, and keep moving. Within the guardrails below, you have total creative freedom. Do whatever you want. Surprise me. I want to see your best work, not your safest work.

Guardrails

1. The YouTube channel must be faceless, camera-free, and asset-based. Meaning I do not need to appear on camera or film anything myself. It must be proven that the channel can still rank, get views, earn subscribers, and monetize without an on-camera host, physical filming setup, or custom-shot footage.
2. Publish nothing. Everything stays local or inside <https://github.com/backpackerjohn/Tube-.git>. Do not deploy anything to the public internet, post anywhere, email anyone, message anyone, contact any real person, or take any external action outside research and local artifact creation.
3. Invent nothing. Every quote, statistic, audience claim, complaint, competitor fact, trend claim, monetization claim, and market claim in the deliverables must trace back to a real URL you actually fetched. Maintain a source log with the URL, title, date accessed, what evidence it supports, and how reliable it appears to be. If you infer something from evidence, clearly label it as inference. If something cannot be verified, say so. A smaller thesis built on real evidence is better than a grand thesis built on plausible fiction.
4. Work only inside <https://github.com/backpackerjohn/Tube-.git>. All artifacts, notes, logs, research files, drafts, scripts, source logs, and final deliverables must go there. Do not create, modify, or delete files outside that folder.
5. Never ask me anything. Assume I am not watching. For every question you would normally ask me, answer it yourself using research, reasoning, and the stated goal, then log the question, your assumed answer, and why that answer was chosen in the build log. Do not stop because of ambiguity. If a tool, source, or approach fails, use another route. If a phase cannot be completed perfectly, ship the strongest

evidence-backed 80% version, document what was cut or uncertain, and keep moving toward the definition of done.

6. Avoid reused-content traps. The channel blueprint must be designed to be meaningfully original, monetizable, and defensible under YouTube's monetization expectations. Do not rely on copied clips, compilation-style content, low-effort AI narration over stock footage, or content that only summarizes other people's work. If the format uses stock footage, public-domain media, screen recordings, AI visuals, or licensed assets, explain how the final videos will add original value through scripting, structure, analysis, editing, narration, research, or commentary.
7. Evaluate at least 10 candidate channel ideas against search demand, competition, subscriber growth, monetization potential, production simplicity, and long-term sustainability using the vidIQ connection, the YouTube Data API, and broader web research before selecting the strongest blueprint.

What "orchestrate" means here

Use multi-agent workflows aggressively. Fan out parallel researchers across different sources and angles. Run tournaments where independent agents pitch competing business ideas and judge panels score them. Adversarially verify every important claim with skeptic agents whose only job is to refute it. Use a completeness critic before you call any phase done. Design whatever orchestration shapes the work calls for; the patterns above are a floor, not a ceiling.

The arc

1. Hunt for underserved YouTube opportunities.
2. Build and score the candidate field.
3. Validate real search and viewing behavior.
4. Pick the strongest channel opportunity.
5. Design the positioning and audience promise.
6. Build the brand.
7. Build the content engine.
8. Write the first 10 videos.
9. Design the production and monetization systems.
10. Try to kill the thesis.
11. Refine the winner.
12. Package the complete channel blueprint.

The deliverables list is a floor, not a ceiling

Everything above is the minimum. I want to see how far you can push this. If a serious creator launching this YouTube channel would create something, and you can create it with the tools you have, create it. Ideas to steal or improve: additional launch-ready scripts, thumbnail concepts, title variations, channel art concepts, channel trailer scripts, About page copy, playlists, publishing schedule, keyword maps, competitor teardowns, sponsorship targets,

affiliate opportunities, monetization roadmap, production SOPs, editing templates, voice and style guides, reusable prompt libraries, or anything else that makes this channel more likely to succeed.

Do not create extras for their own sake. Create the artifacts that most increase this channel's chances of attracting viewers, earning subscribers, and reaching monetization quickly. Invent at least one deliverable that a top YouTube strategist would include but most people would overlook. Every extra goes in the recap page's deliverables map like everything else. Quality still beats quantity: one polished, evidence-backed artifact beats three rushed ones.

Definition of done

You're done when a stranger could open recap.html, understand the YouTube opportunity in five minutes, review the evidence, and have everything needed to launch the channel this month. Before you finish, grade yourself against this list and fix anything failing: every guardrail held; every factual claim, statistic, competitor insight, audience claim, and market claim traces to a verified source; the chosen opportunity is supported by evidence from the vidIQ connection, the YouTube Data API, and broader web research; at least 10 candidate channel ideas were evaluated before selecting the winner; the channel demonstrates real audience demand, attainable competition, repeatable content opportunities, and a credible path to subscriber growth and monetization; the brand guidelines are complete enough for a stranger to create new on-brand assets; the first 10 launch-ready videos are complete; the recap page links to every deliverable and every link works; the red team ran and its objections are visible in the final documentation; and nothing in the package is a placeholder pretending to be finished work.

Now go build me a YouTube channel.
